

Panoramic checklist for iPhones

By Rene Charles Ritchie

Taken from [this article](#) on the Fracture Blog.

- 1 ● Open the iPhone camera and set up mini-tripod. (recommended for a stable shot)
- 2 ● Apply lens of your preference.
- 3 ● Adjust exposure by tapping once on the screen to grab a focal point. Hold down on that point to lock the exposure.
- 4 ● Apply the grid feature to keep your horizons straight. To find this feature, toggle on the native camera app.
- 5 ● Lock your arms and bend your body rather than moving the phone for smoother edges.
- 6 ● Position the camera vertically and pan upwards rather than side-to-side for #swayingstructures effect. You can also tilt to the left/right to change the effect.
- 7 ● Take as many shots as you need before getting one that looks “realistic” or that is stitched together perfectly.
- 8 ● Experiment and take photos of everything. You never know what you can do if you don’t try.
